                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated prostate-specific polynucleotides, polypeptides, fusion proteins of the polypeptides, antibodies raised against the polypeptides (or antigenic ephthopse derived from them) and antigen-presenting cells expressing the polypeptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypeptides, polynucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate cancer. Compositions comprising the polynucleotide and/or polypeptide are useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The prostate specific polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New human prostate-specific polypeptides and polynucleotides useful for the diagnosis and treatment of cancer, especially prostate cancer.

                                                                                                                                                                                                                                                                                       Example 13; SEQ ID NO 706; 85pp; English.
```

```
The present invention provides prostate-specific coding sequences and their encoded proteins. These can be used in the diagnosis and treatment of cancers, particularly prostate cancer. The present sequence is a protein described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Dillon DC, Mitcham JL, Harlocker SL, Jiang Y, Henderson RA; MD, Fanger GR, Retter MW, Stolk JA, Day CH, Vedvick TS; D, Li SX, Wang A, Skeiky YAW, Hepler WT, Hural J;

                                                                                                                                                                                                                                                                                                                                             ö
             The invention describes a fusion protein comprising at least one amino acid sequence of immunogenic portions of any of the 3 sequences not defined in the specification, or sequences having at least 70 or 90 $ sequence identity to any one of the 35 sequences defined in the USPTO web site, which is encoded by any of the 4 modeotide sequences not defined in the specification. The fusion protein, composition and methods are useful as markers to indicate the prostate cancer. The proteins are useful as markers to indicate the presence or absence of cancer. This is the amino acid sequence of a prostate cancer therapy associated protein. Note: The sequence of a prostate cancer confirmed presence of the prince of th

                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                 The present invention relates to novel prostate-specific proteins (PSP) and their coding sequences. The PSPs and their coding sequences are useful for stimulating an immune response in a patient, or for treating prostate cancer in a patient and for determining, detecting or diagnosing the presence of a cancer in a patient. The present sequence was used to illustrate the invention
                                                                                            New prostate-specific proteins and genes, useful in gene therapy, particularly for stimulating an immune response in a patient, or treating prostate cancer in a patient, as well as for diagnosing prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, prostate specific cDNA, cytostatic, immunostimulant, gene therapy, cell therapy, vaccine, T-cell epitope; class I major histocompatibility complex allele, MHC; prostate cancer; tumour; antigen presenting cell.

The invention relates to an isolated polypeptide comprising no more than 11-542 amino acids of ADB1363 comprising a sequence ADB14647. The peptides comprise a fragment ADB1363 of that contain naturally processed T-cell epitopes for 3 class I amajor histocompatibility complex (MHC) and least a ADB1363 is a polypeptide encoded by a human prostate specific cDNA, one of 648 disclosed as new. Also included are nucleic acids is reasformed with the vector, an isolated antibody (or antigen binding transformed with the vector, an isolated antibody (or antigen binding ransformed with the vector, an isolated antibody (or antigen binding ransformed with a binding agent that binds to the protein or peptide, detecting the protein or peptide, detecting apparing as ADB1359, detecting the amount of polypeptide to a predetermined cutter agent and comparing the amount of polypeptide to a predetermined cutter agent and comparing the amount of polypeptide to a predetermined controlled and the comprising the applieds or proteins stimulating or expanding T cells specific of a tumour protein comprising to expanding T cells with the peptides or the isolated T cell population, treating prostate cancer in a patient comprising deministering a composition of cancer in a patient comprising the peptides or antigen prostate cancer in a patient comprising to the peptides or antigen presenting cells that express or conclusion a patient with the peptides or antigen presenting cells that express the thypidises to nucleic acid encoding the presente of cancer in a patient. The peptides for an oligonalectic confined or antigen-presenting cells expressing the nucleic acids and peptides. Antigen present sequence is a patient. The peptides or treat curled are used to simulate an immune response or treat control of the invention. Note: Except where otherwise indicated, the control of the prince data for this patient. The peptides, mucleic acids and peptides are used to simulate an immune response or treat control of the invention. Note: Except where oth

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is encoded by a prostate cancer-associated gene, whose CDNA is represented by Incyte clone number 1864683. The CDNA sequence is used in the method of the invention. The specification carriers a method for identifying biomolecules for the diagnosis or treatment of diseases associated with cell proliferation. The method comparises examining polynuclocatides, consisting of prostate cancerspecific genes, and genes of unknown function, expressed in CDNA libraries. The patterns of both gene sets are compared to identify genes of unknown function with similar expression patterns to the prostate cancer-specific genes. The biomolecules identified by the method form pharmaceutical compositions useful for the diagnosis and treatment of diseases associated with cell proliferation. Such diseases include cancer of the adrenal gland, bladder and bone, but especially prostate cancer. The method may also be applied using other disease- specific genes. The prostate cancer specific genes facilitate the diagnosis and treatment of prostate cancer.
                                                                                                                                                                                                             note= "potential casein kinase II phosphorylation site"

The present invention relates to novel prostate-specific proteins (PSP) and their coding sequences. The PSPs and their coding sequences are useful for stimulating an immune response in a patient, or for treating prostate cancer in a patient and for determining, detecting or diagnosing the presence of a cancer in a patient. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   treating

```

The invention relates to an isolated polypeptide comprising no more than 11-542 amino acids of ADB13563 comprising a sequence ADB14487. The peptides comprise a fragment ADB13563 of that contain naturally processed T-cell epitopes for 3 class I major histocompatibility complex (MHC) alleles. ADB13563 is a polypeptide encoded by a human prostate specific cDNA, one of 648 disclosed ass new. Also included are nucleic acids encoding the proteins and peptides, expression vectors, a host cell transformed with the vector, an isolated antibody (or antigen binding the proteins and peptides, expression vectors, a host cell transformed with the vector, an isolated antibody (or antigen binding the presence of a cancer in a patient (comprising contacting a patient sample with a binding agent that binds to the peptides or a polypeptide to appearing as ADB13558, detecting the amount of polypeptide to a predetermined cut-off value to determine the presence of cancer), a fusion protein off value to determine the presence of cancer), a fusion protein comprising the peptides or the isolated T cell population, treating prostate cancer in a petient comprising administering a composition comprising the peptides, nucleic acids, antibodies or composition comprising the persence of a cancer in a patient and treating prostate cancer in a patient comprising

```
incubating cluster of differentiation (CD4+) and/or CD8+ T cells isolated from a patient with the peptides or antigen presenting cells that express the peptides so that the T cells proliferate, and administering the express proliferated T cells to the patient. The peptides (or an oligonucleotide that hybridises to nucleic acid encoding them), is used to detect the presence of cancer in a patient. The peptides, nucleic acids encoding, or antigen-presenting cells expressing the nucleic acids, are used to stimulate or expand T cells specific for a tumour protein. The peptides, nucleic acids, antibodies, fusion proteins, T cell populations or antigen presenting cells are used to stimulate an immune response or treat prostate cancer in a patient. The present sequence is a prostate specific protein of the invention. Note: Except where otherwise indicated, the sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from USPTO the sequence thunl?Doc1D=20030185830.
                                                                                                                                                                                                                                                                                                                                                                                                        ö

AARD05220-AAD05282 represent cDNAs corresponding to 21 human secreted protein genes, and AAE01352-AAE01413 represent the proteins they encode. AAE014131 represent human secreted proteins they encode. AAE014131 represent human secreted proteins and their genes are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy.

The secreted proteins and be diagnosed by determining the amount of the new procein in a sample or by determining the presence of mutations in the prevence of the inventor of proteins in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune disorders (e.g., rheumatoid arthritis), inflammation, allergies, contrological disorders (e.g., Alzahier's disease, Parkinson's disease), cognitive disorders, schizophrenia, asthma, skin disorders (e.g., pregnancy-related disorders, atherosclerosis, cardiovascular disorders, psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, candiogenic disorders, kidney disorders, gastrointestinal disorders, profuleration, to prevent skin aging due to sunburn, to maintain or provent skin aging due to sunburn, to maintain or provent skin aging due to sunburn, to maintain or presenter trissues, to identify their cognities or all on chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used as a food additive or regenerate nentioned above, and in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassay or enzyme linked immunosorbent assay (ELISA). The
                                                                                                                                 New nucleic acid encoding one of 21 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions, such as autoimmune disease and cancer, and used as a food additive or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  9 gene; prostate disease; benign prostatic hyperplasia; BPH;

New isolated prostate-specific polynuclectides - used to develop products for the diagnosis and treatment of prostate diseases, e.g. benign hyperplasia, prostatic or prostate cancer.
                                                                                                                                                                                                                                                                                                                The present sequence is encoded by the consensus sequence for a PS108 gene. The sequences are PS108 gene-genefic. They are used in the method clone sequences are PS108 gene-specific. They are used in the method of the invention. The specification describes a method for detecting the presence of a target PS108 polynucleotide in a test sample. The method comprises contacting the test sample with at least 1 PS108 specific polynucleotide or complement, and detecting the presence of the tracet PS108 polynucleotide. The products can be used for detecting, diagnosing, staging, monitoring, prognosticating, in vivo imaging, preventing or treating, or determining predistosition to diseases or conditions of the prostate such as benign prostatic hyperplasia (BPH), prostaticis, prostatic intraepithalial neoplasia (PN) and cancer. In particular the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                    d
                                                                                                                                                                                                                                                         ô
                                                                                                     The present invention is related to a number of partial coding and protein sequences for the human prostate tissue protein PS108. These sequences can be used in the diagnosis and prognosis of prostate diseases, particularly prostate cancer. They can also be used to produce antibodies which can be used in treatment. The present sequence is one of the PS108 partial protein sequences
                        Methods for detecting target prostate-specific polynucleotides or diseases of the prostate (e.g. prostate cancer), comprising detecting the presence of any of PSIO8 nucleic acid sequences in a test sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence represents the amino acid sequence of prostate-specific PS108 #1, encoded by PS108 expressed sequence tag (EST) consensus sequence. The sequence was produced from overlapping PS108 ESTs sequences to produce a full length consensus sequence. This sequence was then used to produce the PS108 polypeptide which is useful in assays for detecting antibodies to prostate trissue, and as an immunogen to produce antibodies. The polypeptide is useful for screening compounds which specifically bind to the polypeptide and for screening for drugs, compounds, or any other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Prostate; PS108; immunogen; drug screening; image localisation; diagnostic; therapeutic; prostate tissue disease; cancer; metastasis; expressed sequence tag; EST.

ö
agent which can be used to treat diseases associated with PS108. The antibody is useful to detect, or for image localisation of, PS108 antigen in a patient, for detecting or disagnosing a disease or condition, as delivery agents for therapeutic agents as well as for diagnostic tests and for screening for diseases or conditions associated with PS108, and for screening for diseases or conditions associated with PS108, antibodies for therapeutic use, for inhibiting the biological activity of PS108 in therapy (for e.g. to treat prostate tissue disease including prostate cancer and its metastases), and to detect the presence of any polypeptide in a test sample which shares one or more antigenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel PS108 polynucleotides derived from the PS108 gene, useful for detecting, diagnosing, staging, monitoring, prognosticating, in vivo imaging, preventing or treating diseases and conditions of prostate e.g., prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gordon J;

The PSPs and their coding sequences are useful for stimulating an immune response in a patient, or for treating prostate cancer in a patient and for determining, detecting or diagnosing the presence of a cancer in a patient. The present sequence was used to illustrate the invention
            The present invention relates to polynucleotide sequences derived from the human PS108 gene and capable of selectively hybridising to the PS108 gene. The sequences can be used to detect the presence of a target PS108 polynucleotide in a test sample, and to detect, monitor, prevent or treat diseases and conditions of the prostate, such as prostate cancer. The present sequence is a PS108 protein fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New prostate-specific proteins and genes, useful in gene therapy, particularly for stimulating an immune response in a patient, or treating prostate cancer in a patient, as well as for diagnosing prostate cancer in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Xu J, Dillon DC, Mitcham JL, Harlocker SL, Jiang Y, Henderson RA, Kalos MD, Fanger GR, Retter MW, Stolk JA, Day CH, Vedvick TS; Carter D, Li SX, Wang A, Skeiky YAW, Hepler WT, Hural J; Mcnaill PD, Houghton RL, Vinals Y De BassolsC, Foy TM, Watanabe Y, Deng T;

-!- CATALYTIC ACTIVITY: An aldehyde + NAD+) + H(2)O = an acid + NADH.
-!- PATHMAY: Ethanol utilization; second step.
-!- SUBCELLULAR : ICCATION Mitochondrial matrix (Potential).
-!- SIMILARITY: Belongs to the aldehyde dehydrogenase family.
-!- CAUTION: Is not present in yeast genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Homo sapiens (Human).

Prevents calls from prematurely exiting mitosis. Required for the assembly of the dynelin-dynactin complex onto kinetochores.

SubMUNIT: Interacts with ZwIO. This interaction is required for stable association with the kinetochore.

Juberling Rocallo Space of Colling the call cycle. At interphase, uniformly distributed thoughout the coll cycle. At interphase, uniformly distributed thoughout the coll cycle. At interphase, detected at kinetochores, along spindle fibers and most prominently at the poles. By late anaphase until the end of telophase, no longer detectable on Kinetochores or along: spindle fibers, but still present at the spindle poles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. C.: FUNCTION: Removes the formyl group from the N-terminal Met of newly synthesized proteins. Requires at least a dipeptide for a efficient rate of reaction. N-terminal L-methionine is a preferedusite for activity but the enzyme has broad specificity at other positions (3% similarity).

C.: CATALYTIC ACTIVITY: Formyl-L-methionyl peptide + H(2)O = formate + Capture Sands liven(II) ion (3% similarity).

C.: CORACTOR: Binds I iron(II) ion (3% similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright. The Brucella suis genome reveals fundamental similarities between animal and plant pathogens and symbionts."; 2002).

The Co. Natl. Acad. Sci. U.S.A. 99:13148-13153 (2002).

The Town Natl. Acad. Sci. U.S.A. 99:13148-13153 (2002).

The Town Natle State of Formyl group from the N-terminal Met of newly synthesized proteins. Requires at least a dipeptide for an efficient rate of reaction. N-terminal L-methionine is a prerequisite for activity but the enzyme has broad specificity at other positions (By similarity).

C.-I-GATALINITY ACTIVITY: Formyl-L-methionyl peptide + H(2)O = formate +

TISSUE SPECIFICITY: Found within the stromal cells in close contact to the vascular structure of placental villi, yolk sac, fetal liver, adrenal cortex and pancreas and in the beta cells of the islets of langerhans in the adult pancreas. Found also in some forms of neuroendocrine lung tumor tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           SEQUENCE FROM N.A.

"Glycosylation analysis and protein structure determination of murint fetal antigen 1 (mFA1) - the circulating gene product of the delta-like protein (dlk), preadipocyte factor 1 (Pref-1) and stromal-cell-derived protein 1 (SCP-1) cDNAs.";

Eur. J. Blochem. 244:334-342(1997).

-!- FUNCTION: May have a role in neuroendocrine differentiation.

Thibits adipocyte differentiation.

-!- SUBGELLULAR LOCATION: Type I membrane protein.

-!- ALTERNATIVE PRODUCTS:

RESULT 1

This sequence is encoded by a human prostate tumour specific gene, and can be used in the method of the invention. The method is for detecting prostate cancer comprises contacting a biological sample with an agent able to bind an immunogenic portion of a prostate protein (such as this protein sequence). An antibody which binds to an immunogenic portion of the prostate protein, and the method can be used to detect, monitor the prostate protein of, or treat prostate cancers. The antibody may also be conjugated to a therapeutic agent for use in therapy of prostate cancers. (Updated on 25-MAR-2003 to correct PR field.) Novel human prostate specific tumour protein and fragments - useful for detecting and treating prostate cancers. Prostate tumour specific gene; human; prostate cancer; detection; Prostate tumour specific gene clone L1-12 protein. Example 1; Page 87-89; 141pp; English. The present sequence is an immunogenic portion of a prostate tumour protein. The immunogen, or the DNA encoding it, can be used as a vaccine for the treatment of prostate cancer. The immunogen was isolated from a prostate tumour cDNA library obtained by subtracting a prostate tumour cDNA expression library with a normal tissue cDNA library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PVLGLVCVPLLGSASDHWRGRYGRRRPFIWALSLGILLSLFLIPRAGWLAGLLCPDPRPL

The present sequence is encoded by a cDNA sequence which was isolated from a breast tumour cDNA library. It is provided in a specification relating to compounds for immunotherapy and diagnosis of breast cancer. Breast tumour antigens and the polymuoleotides that encode them may be used in the production of a pharmaceutical composition to be used in the treatment of breast cancer. Proliferated T cells and incubated antigen presenting cells are also required. The polypeptides and polymucleotides may also be used to produce a vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes isolated polypeptides, comprising an immunogenic portion of a prostate tumour protein (PTP). The polypeptides and polymucleotides encoding them have cytostatic activity and can be used in vaccines and in gene therapy. The polypeptides and polymucleotides encoding them, antigen presenting cells which express the polypeptides, antibodies against the polypeptides and vaccines comprising them can be used for inhibiting the development of prostate cancer in a patient. The polypeptides can be used to generate antibodies or antibodies for passive immuno therapy. A portion of the polypucleucides encoding the polypeptides can be used as a probe or to modulate the expression of the polypeptides. AAA06241 to AAA06691 and AAX82000 to AAX82020 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

The present invention relates to a new polypeptide comprising an immunogenic portion of a prostate protein. The invention is useful for inhibiting the development of prostate cancer in a patient. The invention is also useful as markers for diagnosing prostate cancer and for monitoring diseases progression in patients. The present amino acid sequence represents a human prostate tumour protein
                                                                                                                                                                                                                                                                                                                                                                                                                240
                                                                                                                                                                                                                                                                                                                                                                                                                                            240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               360
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         360

polypoptides, fusion proteins of the polypoptides, antibodies raised antigen-presenting cells expressing the polypoptides raised antigen-presenting cells expressing the polypoptides. The antibodies are useful for detecting the presence of cancer, especially prostate cancer. The polypoptides, polymucleotides and the antigen-presenting cells are useful for stimulating and/or expanding T cells specific for a tumour protein, and for inhibiting the development of cancer especially prostate useful for stimulating an immune response, and for treating cancer. The oligonucleotide is useful for detecting cancer. The prostate specific polypoptide of the invention

                                                                                                                                                          8
                                                                                                                                                                                                          엄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes polynuclectide sequences (I) which encode prostate-specific proteins (II). (I) and (II) have cytostatic activity, and can be used in vaccine production and gene therapy. (I), (II), antibodies to (II), fusion proteins comprising (II), and isolated T cells prepared using (I) or (II) are used treat cancer in a patient. (I) and the antibodies are also used in the detection of cancer in a patient. The cancer that is diagnosed or treated is particularly prostate cancer. (I) and (II) can be used in vaccines. The antibodies or (I) can be used for monitoring the progression of cancer in a patient. (I) and (II) can also be used to improve diagnostic and therapeutic methods for prostate cancer. They can indicate the level of metastasis as well as the prostate volume. AAH93357 to AAH933944 and AAMOIIIS to AAMOI318 represent
